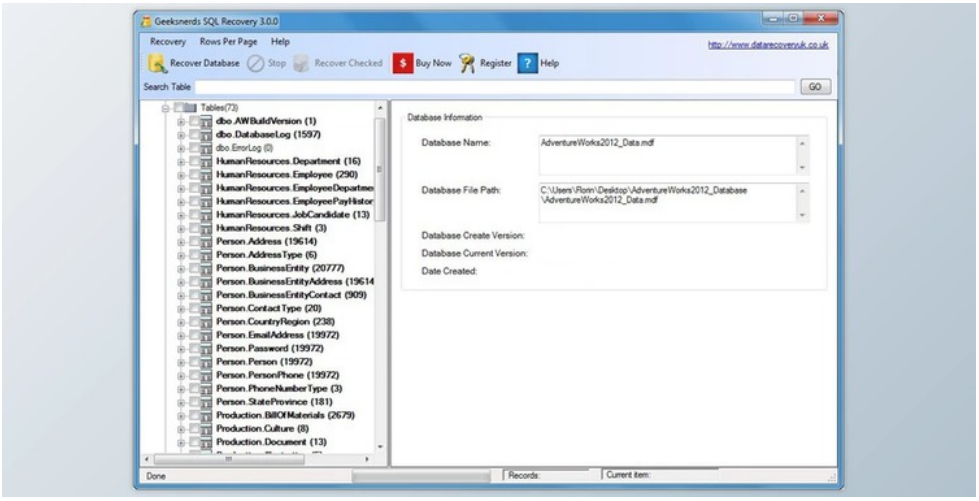
Geeksnerds SQL Recovery v3.0.0

2024-12-29 09:07:07



Geeksnerds SQL Recovery is a tool that lets users fix damaged MDF files quickly and easily. The program can restore data from databases and other objects like indexes, triggers, or functions.

To get the data you want, it is necessary to choose to open the MDF file. The program will scan it and show identified contents. In this way, you can select what you would like to retrieve and save them.

Microsoft SQL Database is used to store information within a relational table. SQL database may suffer from physical or logical corruption. Media on which the data be stored is more susceptible to losses; however, you might not be able to get another chance to recover. It is crucial to select the right company to recover your database if the disk where the database cannot be recovered. Geeksnerds requires the sophisticated media/drive to allow it to be accessible within our laboratory.

Geeksnerds SQL recovery software is a reliable and versatile repair tool that repairs corrupted or inaccessible databases. It is a SQL recovery software that can execute the MDF recovery process following any corruption, such as attacks by viruses, short header for the database file hardware or software malfunctioning inadequate space, etc., as well as other causes that can be fatal. Geeksnerds SQL recovery software fixes MDF files created using Microsoft SQL Server 2000, 2005 2008, 2008, R2, and 2012. It then extracts triggers, tables, views stored procedures and functions, rules, types of user data constraint, indexes, and more. FIt also recovers damaged or partially damaged or deleted records stored in different multi-volume files.SQL recovery can also retrieve XML indexes XML column types and sparse and file stream data types and partitioned tables in MDF files. SQL recovery can save database object scripts in the form of a text file—foreign keys.
