SilkyPix Developer Studio v12.0.4 (Win, Mac-v11.0.17.0):

Since the introduction of the SILKYPIX collection in the year 2004, the latest demonstrationsaicing technology "Clear view" has been included as the demosaicing tech which is the basis of processing images. It is the "Clear view*" is used by default and can create more high-resolution images than you have ever seen the moment you launch SILKYPIX. You can also utilize the earlier demosaicing engine "Standard" as well.

"SilkyPix Developer Studio" Sample:

New Composition Modes

There are two new modes for composition in the game, which allow you to create diverse worldviews. Eight composition modes have been added.

Super-resolution

Enhance images 1.5x or 2x and combine them using our technology for detecting image coincidence (patent No.4689758). When the images are combined using the highest accuracy and half-pixel level alignment to produce the image with super-resolution. The super-resolution image is composed of a lot of pixels, the high-resolution image is possible to express even when printing big prints and cropping.

It is able to support images of less than 9000 pixels on the long side.

Multiple exposures (moving subject) composite

In a well-known and renowned multiple-exposure composite, the moving object is composited using an error in alignment. Utilizing the latest "Multiple exposures (moving object) composites," the only moving objects within the selected image are kept, and those in other images are removed from the composite.

Utilization of the Next-Generation Image Metadata

You can easily apply partial corrections by selecting "Portrait," "Skin" or "Sky" of the Object information (Semantic Masks) included in the DNG data.

Color conversion using a fine-detailed color gamut

The fine-tuning of the color conversion could be difficult because of the broad conversion range of the standard fine color controller, however, we've added the advanced mode, which can regulate the color conversion within the fine-detailed color range. This mode lets you select the color gamut you want to convert completely and adjust the intensity and hue of the gamut with great detail. It can, for instance, be made possible to create dramatic color changes like when the blue sky transforms into the color of a sunset.

Remove Unwanted Objects

The "Retouch" tool "Retouch brush tool" makes it possible to get rid of unwanted objects by drawing them using this tool. Two functions are available within"the "Retouch brush tool"; "Copy" to copy the original image onto the undesirable object and "Retouch" to blend the surrounding color of the object. Both functions can be utilized in conjunction, depending on the requirements or goals.
