What is New at **Telerik UI for PHP?**

New Stepper Component For Telerik UI for PHP

The recently Telerik UI to get the PHP Stepper controller is here to help you break the behavior down. The intention is to steer the user towards every one of the things which have to be carried out to attain the whole. Steps can be discretionary or mandatory, and the consumer might be forced to receive the liberty to choose them or to perform them. Place in also the Stepper part becomes a device along with one of the components can be altered and all our PHP Form element combined.

New TileLayout Component For Telerik UI for PHP

The TileLayout controller for Telerik UI for PHP is a controller directed than in the app's inventor. It is a container that lets the breeze change and rearranges.

New Telerik UI For PHP Form Part

The Telerik UI for PHP Form part is the best instrument for generating some or enrollment, contact another form! It's not hard to establish and does the majority of the work independently (like creating input fields based upon your information) but also includes a great deal of flexibility like validation callbacks or change visuals.

New TextBox Component for Telerik UI for PHP

The TextBox control for Telerik UI for PHP is a component -- a text input with all the features from fundamentals such as styling and events!

Remote (server-side) Grid Grouping for Telerik UI for PHP

This is a feature requested by a number of you! We're currently making items in the Telerik UI for your PHP Grid part. By allowing one feature, whenever users ask that the Grid set several components collectively (e.g., all goods being offered in a specific store), the group procedure will operate on the machine. This frees up the customer while awaiting the host to process the outcomes but also makes it quicker is very likely to be more useful to show a loading screen.

Part Improvements: Scheduler

To get PHP Scheduler control these months to add a ton of new features we worked on the Telerik UI:

- We have supported bunch resources together for a little while, but with this launch, **Vertical Grouping is currently virtual**! Your browser will no longer be slowed down by interacting with calendars.
- The Scheduler is currently able to **export and import information from most popular calendar customers** such as Outlook, Google Calendar, and Apple Calendar. This is as it is compatible and so compatible with the iCalendar specification.
- Overbooked calendars have another advantage -- that the Scheduler **currently includes a search bar** through that users can quickly Discover the occasion they Are Searching for
- **Working times can now be changed** to adapt to the non-standard functioning time.

Component Enhancements: Floating labels

Floating labels (tags which exist within the components of the input signal they explain) are becoming more and more common and also a basic of Material Design. With this launch, MaskedTextBox, our TextBox, and NumericTextBox parts will have Floating labels offered.

Component Improvement: TimePicker, DatePicker, DateTimePicker and Calendar Rendering

We believed the Telerik UI for PHP might use some cleanup because of Calendar elements and the TimePicker DateTimePicker, so we have added every one of them and a fresh look with this particular launch. The rendering style is the standard so that you won't receive any surprises -- but you can change to the visual you desire once you update to the version.
