Blender Market - Render Time Calculator V3.0.0:

Introducing an essential Blender add-on designed to streamline your animation rendering process by calculating the total time required for completion.

- Simple Mode: Provides a single input option for quick estimations, offering a less detailed but convenient output.
- Advanced Mode: Enables multiple inputs for a more accurate estimation, taking into account variations in rendering times across frames.
- Displays:
 - Total time required for rendering
 - Remaining frames to be rendered
 - Estimated remaining time
 - Projected finishing time
 - Progression status

Limitations:

Requires manual input of rendering time for one or more frames.

Accuracy may be compromised if rendering times vary significantly across different parts of the animation, though this is mitigated by the advanced mode's capabilities.
