Our primary aim in developing these plug-ins was to deliver versatile compressors with meticulous control and an exceptionally musical sound. Unlike models based on specific hardware, PSP oldTimer draws inspiration from vintage circuitry, aiming to emulate the favourite characteristics of such compressors.

PSP oldTimerME introduces advanced features, allowing exclusive processing of the left, right, mid, or side channels while maintaining a user-friendly setup.

For PSP oldTimer, the focus was on creating a straightforward compressor that provides an exceptionally musical sound with minimal tweaking. Remarkably easy to use, PSP oldTimer resists sounding unfavourable even in extreme settings. While offering soft and smooth compression in most applications, it may impart a subtle colouration to the sound through tube emulation on transients when subjected to high compression values.

Both versions of oldTimer belong to our series of Zero Latency Processing plug-ins, making them ideal for scenarios such as live monitoring, live broadcast production, and managing levels during tracking.

### What is PSPaudioware PSP oldTimer?

PSPaudioware PSP oldTimer is a software plugin designed for dynamic range compression and limiting in audio production. It emulates the characteristics of vintage analogue compressors, offering a warm and musical sound while providing precise control over the dynamics of audio signals.
