FaceBuilder for Blender:

This tool enables the creation of highly detailed 3D portraits by generating accurate facial geometry from multiple or even a single photo, including non-neutral facial expressions.

It offers AI-powered mesh alignment, an intuitive workflow for aligning reference points, and real-time sculpting for instant feedback in 3D. With one-click texturing, you can seamlessly blend textures from different views, and switch between high, medium, and low-poly models as needed.

The software supports diverse facial types from around the world and integrates with FaceBuilder, FaceTracker for Blender, MetaHuman Creator, and Character Creator 4 for easy export. It also includes 51 ARKit-compatible FACS blend shapes for facial animation and head tracking for live-action integration.

The tool is fully compatible with 3D pipelines, allowing exports in various formats.
