下载页面

Aescript Jump Keyframe is a script designed to make animated properties more accessible by allowing users to update values without moving the Current Time Indicator (CTI) to the last keyframe. The program replaces the previous keyframe with a user-defined value while keeping the ease and label colour set to the frame. It is convenient for users who have to edit multiple layers and have numerous properties with disparate timings on the same layer. When used in conjunction with KBar to avoid navigating the timeline, Jump Keyframe saves time and increases animators' productivity.
