The SiComponents are there to be a VCL agent for the process of scheduling which is a wrapper for the task of Microsoft and the schedule of API. It consists of a core component such as the TTaskScheduler and has the unique support of the classes that will enable the users and the developers along with the RAD Studio, Delphi, and even the C++. It is known to have complete support for Windows Vista as well as the task Scheduler 2 to provide the user the ability to forget about the process of porting the user code to a new interface. This scheduling agent can automatically work with the Vista task scheduler whenever the user applications are running on Windows Vista or later. It has many advantages and the main advantage of the using of the SiComponents the scheduling agent is that a huge part of the work on the maintenance of the task as well as it's launching is mainly performed by the system of operating. In case if the user wants the application to run within the scheduled times then he does not require to put a timer into the application process to make it resident. The user can add the agent of scheduling to the project as well as the windows and it will have launched the user program just in time. It can support the Embarcadero RAD studio and provide new properties for the TTaskTrigger. TTaskTrigger is described as a service that allows the user to perform an automated task on a computer that is chosen by the user and the developer. With the help of this service, the user is capable of scheduling any program to run the party killer program at a convenient time. The Task Scheduler in this case is responsible for monitoring the time or even the criteria of the event that the user chooses and desires and then it performs the process of execution of the task whenever the criterion is met. The Task Scheduler in this case is automatically installed on the operating system of Microsoft. On the other hand, the task scheduler enables the users and the developers to perform routine tasks automatically on the computers that are chosen by them. Whatever criteria the user chooses the task scheduler is responsible for monitoring it. The user can use the task scheduler to execute tasks like the starting of an application, the process of sending an email message or even showing a message box. The task can be scheduled to execute in response to the user and events. In general, a task is a coding unit as well as a report which is scheduled for the process to run at a specific time and data. The tasks in the background session or running between the Dynamics 365 business central service interfaces as well as databases. Behind all the scenes, the task scheduler has been used by the queue of jobs to process the job queue entries which have been created for the process of being managed by the clients.

Some of the features of the SiComponents are stated below:

- It can enumerate all the tasks that are on the target computer of the user.
- The user can create new schedule tasks as well as delete the existing ones based on his choice.
- The user is capable of scheduling a task to run at a specific time or whenever there is a specific event occurrence according to the user or the developer.
- The user can change the Scheduler for the process of the task.
- Modifying as well as other settings for a task can happen by the user for example the process of application of the name, along with parameter string, and finally the process of the working directory and so on.
- The user can run it immediately or can even stop the process of running a task.
- The TTaskProperties Dialog is capable of implementing the standard for the properties of the dialog for the items of the task. The component in this case is capable of providing the users with several properties that will enable and help the user and developer to customize the behavior as well as the appearance of the dialog.
