Pixelmania NNSuperResolution v4.0.0 for Nuke 15.1 (Win/macOS/Linux):

Pixelmania NNSuperResolution is a plugin for Foundry's Nuke that enables 2x or 4x resolution upscaling directly within a composite.

It supports both sequence mode for upscaling image sequences (such as filmed plates, final composites, and CG renders) and still mode for photos and textures.

The plugin processes all RGB channels and can handle multiple layers simultaneously using Nuke's multichannel system.

It supports high dynamic range upscaling, native overscan handling, and is GPU-accelerated with NVIDIA CUDA.

Compatible with Nuke 11.3 and later on Linux, and Nuke 12.0 and later on Windows, including Nuke Indie, this production-friendly solution operates without needing an internet connection.
