Blender market - Text Effects:

Text Effects for Blender is an efficient tool for animating 3D text, letting users apply animation effects (like typewriter, wave, and randomize) without needing complex math or keyframes. This tool is designed around presets and reusable templates, allowing any text in a scene to be converted into animations that can be duplicated, shared, and easily edited.

- **Text Handling:** Supports subtitle import (.srt), text alignment, animated text templates, duplicate animations, replaceable text, font changes, paragraph support, text on curve paths, and custom presets with font saving.
- **Animation Capabilities:** Offers new position effectors, wave animations, custom interpolation curves, paragraph animations, radial propagation, looping, easing (36 interpolations), random transformation, and wiggle effects, along with bakeable animations.
- **Appearance Options:** Adds new fading and random color effects, path alignment options, and customizable materials.

Roadmap: Plans include automated subtitle support, coded effects, using 3D objects as fonts, and manual kerning adjustments.
