

## IDERA DB Change Manager v18.5.0 Build 3433 for Win x64 + Keygen

2024-12-29 14:04:02    label 我要反馈    下载页面

**IDERA DB Change Manager** is considered to handle database changes easily. It can utilize a live-to-live database and compare it to acquire a list of varied subjects for the user and developer to create a change script and synchronize the items that the user and the developer choose. It can catch a snapshot of the goal before the process of implementation of the changes takes place so that the user can roll back a schema change if he requires it. It can automatically synchronize the plan in order to match the origin once there is a very powerful comparison.

Tracking and reporting on the changes permits the user and developer to show and Report the modification process to pack the application database which the seller customization or stains have caused. Uncovering the database deaths by steaming from improper alterations can affect the product performance or even the operation. Informing others or even the user whenever a specific part of the database has been changed. Because of the ability to reveal as well as report the changes to the application of the packages of the databases which result from the patches of the vendor or even the customization process. Uncovering the abnormalities of the database as well as the steaming process from the improper changes that can impact the process of production as well as the performance or the functionality.

The user can notify himself or others Whenever a particular portion of the database is being changed. Ensuring that the pre-production databases are accurate and are tested while protecting information is sensitive. It can protect sensitive data in the production environment management along with the data masking and quickly migrating the mosque yet realistic and fully functional data present in the development and a test environment. **IDERA DB Change Manager** can offer the user and developer a multi-database platform in order to support the major DBMSs written from an interface. This unique capability can expedite the system access and translate the skills of the DBA across the Platforms to reduce the learning curve and the errors. It can include unique SQL Server, Oracle, and Sybase support.
