CINEWARE proxy - aescripts + aeplugins v1.32.001 (WIN, MAC): Live 3D pipeline can be streamlined to Cinema 4D and After Effects CC. It is easy to switch between rendering proxy and live stream files.

When working using Cinema 4D and After Effects, There are generally two choices:

- Create render files using Cinema 4D and import them into After Effects.
- Use the Live 3D pipeline to render C4D Projects as layers within After Effects.

While this is a great option, however, it could be slow when your projects are complicated. When you use the CINEWARE proxy you have the best of both worlds. you can simply switch back and forth between your live 3D pipeline and rendering proxy file. You could, for instance, begin working with the live pipeline and render proxy files while in the background. When background rendering is completed you can change between the live pipeline and the generated files, and discover that all changes you made in the interim are saved.

If you ever need to alter the content of your Cinema 4D project, you can return to your live workflow, or change your proxy settings to view the modifications inside After Effects with just one click.

CINEWARE proxy can also work with existing proxy files you've rendered using the method of preference. To save having to select the right file for each render step manually, the CINEWARE proxy automatically learns the conventions for naming files. You only need to load one file, and the rest will be located automatically. In the future, CINEWARE proxy even remembers your routines and eventually will know where to look to find your data.

- support for multi-pass rendering
- Compatible compatible with background rendering (BG Renderer Pro required, purchase them all together for a discount of 20% off BG Renderer Pro using promo coupon code: BGCINE)
- retains any modifications (effects effects, masks ...) while switching between live pipelines and proxy files.
- Automatically naming proxy files
- Automatically learns about the conventions for naming files
