# SQL DXP for Oracle and MySQL v6.6.1.183 (21 Apr 2022) + Patcher

2025-02-02 16:11:04   label 我要反馈   下载页面

The process of cross-platform compares and syncs the schema and the data for the Oracle as well as the MySQL. In the evaluation of the cross-platform, the user can compare the SQL and the DXP for the databases and hence the Oracle server to Oracle server precisely, in a way that the SQL Delta performs contrast. Later the SQL DXP can move the information and can compare the database servers.

Schema Compare

The schema compare utility allows you to use, and compare the definitions of the databases. The result of the comparison can appear as a set of actions that will be taken with the target in order to make it the same as the source. Once the set of comparison is completed the user can update and later target directly. The comparison can be saved later either as a part of the SQL Server database by the user or as a standalone file. The only difference between the source as well as the target appears in the easy review grid.

Data Compare

In the process of data, compare did they take can be aligned according to the given data types that are being shared. The data compare provides the users with a handy method by which they can transfer the information with the use of the moving web-based MySQL data to a server database of SQL.

SQL DXP for Oracle and MySQL Great Features:

Tabbed Projects

The tabbed project is under the task supervisor. The user can run more or two jobs what is only two schemas compare jobs on the server compare the information, which endeavors on server precisely. While the user is waiting for the compare procedure to finish he is able to conduct an upgrade or review the script. Each method in this case is running in threads. In the group project, it is very much possible to assign each job to either of the groups. The user may put off the information and compare the jobs. Under the single groups, the user can put a server group of posts.

Schema View

The schema view allows the view of the database and it is an editor role that reveals the schema of the user's database. Do the user may find the information inside the table or view information's for items regarding the tables and the views. If the user is looking out for something, then he can easily find the elements schema perspective and can filter down to the number of items being defined. Some of the dynamic queries are the DDL and the DML. For instance, the schema can compare and reveal a sudden change and the user also wishes to assess the information. That particular information may be relating to the origin and the database target. If the user's endeavor is duplicated by the manager of the project, then it will change to some schema undertaking and later can execute it. Now the user can find the schema as well as the data within the perspective and tables. This correct information explains the remarks as well as the shift from the supply table information.

Snapshots

Snapshot is an XML representation of the schema of the database and the document can be saved and stored with control or copied versions it has two different places for a schema backup. There are two schema view jobs as well as the schema compare that can generate the snapshot for the schema of the database. A simple photo can be utilized for supplying a means to restore from the backup and compare the changes between the snapshot husband of the origin of schema compare.

Reports

Database   Tools

They use will find four compare two schemas along with their report and reports that are out in the Schema compare. Each and every story in this case is made, right within the files of the HTML. The four reports are capable of giving various degrees of details to the schema compare to the user. The Source or the target schema report can create an HTML file and hold the schema details.

A data compared to report which is a summary of the HTML document that demonstrates the information as well as compares to gaps for the endeavor.

In the schema reports, the HTML creates a view of HTML of the items as well as the documents in order to demonstrate the schema of the database.
