Blender Market - Ae2Blend v1.3.1

Blender Market - Ae2Blend focuses on enhancing Blender with After Effect keystrokes. Instead of translating every action performed in After Effects into Blender for the user, It saves the hassle of going through all that rigmarole by letting the users copy-paste any transform values into the objects in Blender. AE2Blend also enhances matchmaking processes by allowing users to import camera moves created in After Effects to Blender and apply them in a 1:1 scale. Transformations can be made to existing objects, or new ones can be created, making the relationship between the two programs very fluid.

- Effortlessly transfers keyframe data from After Effects for use in Blender.
- Able to process unmoving and moving Position, Scale, Rotation, and Orientation data.
- Enhance data translation control with scale tools and standard metric scale calculations.
- Enable accurate placement of keyframe data using the After Effect playhead or Blender's 3D cursor.
- Load keyframe data in Blender while creating new objects such as empty, plane or camera.
- After effects, camera tracker data are integrated to facilitate matchmaking.
