

Aescripts React v2.0.1

2025-02-10 16:43:47 [label](#) [我要反馈](#) [下载页面](#)

Create grids, radial, or linear repeaters and control using fall-off and random and step effectors.

Super simple, super quick

With just a few clicks, **React** can create a grid, linear or radial repeater, to any layer.

Control the repeats using falloff (circular linear, linear, or box) or random effectors. Use all three!

Modes

Position

Change the value of position with three different modes

- Relative
- Absolute
- Attract/Repel

Rotation

You can rotate your layers by using two different rotation modes two modes

- Relative
- Have a Look

Scale & Opacity

Use the falloff feature to increase the size of your layers uniformly or by individual dimensions.

Modify the opacity and cause fade effects within your repeater.

Take a Look at These Features!

Check At Mode

Choose"Look at" in the dropdown menu for Rotation mode; voila, the layers will face your goal.

Alternate your goal and offset your rotation to obtain the desired effect.

You can use it with and without falloff control.

Attract/Repel Mode

Select Attract/Repel in the dropdown menu for Position mode and move the slider.

Positive numbers force layers away from the goal; Negative values draw them toward it.

Utilize with falloff or no control.

Fine-tune your repeater

Add multiple effectors

More effectors = more fun! Utilize at least two effectors on one layer to produce ripple effects and more complicated

animations.

Custom-designed to ease

After Effects has its sensibilities for expressions (linear ease in, ease out, linear out, ease into and out, ease in), However, however looking for more control? Adjust your interpolation to perfection using **React's** ease settings.

Work using 3D layers.

Even though **React** is designed primarily for 2D usage, you can still use it to influence the repeated layers' Z position, scale, and 3D orientation. Simply switch your layer's 3-D toggle.

The Sticky Modifier

It's getting sticky

The brand new Sticky modifier "sticks" output values to the nearest to that Sticky moderator's input.

(OK, I know, it's a bit similar to rounding numbers, but calling it"Rounding Modifier" is not a good idea.)

Works using Text Layers!

Controlling dynamically

Separate text into letters (including spaces), alphabets (excluding spaces), words, and lines and control them using effectors.

Updates at the time you press

React can create the text guide layer, which serves as a template master for your repeating layers.

New Features:

- Progress Bar
- When duplicating or deleting layers, a progress bar has been included.
- Separate Dimensions - Bug Fix
- Fixed bug which prevented React working with layers with separate dimensions turned on.
- Improved support and better error messaging for online activation
- Fixed error in alert to open After Effects preferences to allow scripts to access network
