

FX Gradient v1.0 Full Pre-Activated

2025-02-10 16:38:32 [label](#) [我要反馈](#) [下载页面](#)

The Very **user-friendly** Way to Make Innovative gradient Drops in After Effects! Easily produce and edit radial, linear, angular, and mirrored together with the click of a switch, and then colorize them together with a few of those 30 stylish and useful color presets. Even include some distinctive FX choices such as decking grain and turbulence!

An easy toolset Which Allows you to create your desired gradient Form in a very quick and convenient manner, simply by clicking on the corresponding icon, just as you'd do within additional Adobe Programs.

The 4 most gradient kind buttons respond differently based upon the shortcut that you use while pressing on them

- Using SHIFT (+ click), it is possible to rotate the gradient contour by 90° (far handier than simply tweaking both the beginning and end-stage of this native gradient effect!)
- Using ALT (+ click), you are able to invert both colors of this gradient ramps (does exactly the same as though you'd clicked the"sew colors" button at the native result).

Prior to clicking the gradient kind button (however you can get it done Afterwards too, provided that you honor a couple of requirements, as explained in the following paragraph), then you are able to opt for a color plot one of 30 carefully handcrafted presets:

The 21 initial ones (displayed on the left side) are Simply a mix of two colors, whereas the 9 previous ones at the dropdown list (displayed on the right at the picture above, and comprising a (C) letter in their title) operate somewhat differently. Really, those 9 unique color presets will employ a Colorama impact, which enables you to include over two shades in the color wheel, and also to correct their transparency separately (that the Alpha (C) preset is a little more special; you are going to have to colorize it using a fill effect in addition to it because it comes in black color only).

Remember You Will be Able to alter the colors of your gradient later by altering the preset choice from the dropdown list while the coating with **FX gradient** applied for it's chosen, but in case you've started by employing one of the 21 initial"fundamental 2 colors ramps" presets, then you won't have the ability to employ a (C) Colorama centered preset. Conversely, if you'd started to employ the 9 past (C)Colorama established presets, you will not have the ability to alter the colors by simply selecting among the 21 initial"fundamental 2 colors ramps" presets later.

Another Wonderful addition is that even By simply altering the chosen preset from the color dropdown list, it can apply these two color schemes to some"Gradient slide" or perhaps the "Tint" effect applied to a chosen layer. This really is a fantastic method to test unique colors to display some footage using the keyboard's UP and DOWN arrows!

- **Completely compatible with all the YYramp+ plugin:** The **FX Gradient** toolset is totally compatible with YY Ramp+, also, it works much better with this!

Truly, YYramp+ produces actual gradients - whatever form it's - at no time as it's a plugin, although - with no plugin - whereas FX gradient with its own sort of"imitates" these specific same contours (angular, mirrored...) and alternatives, by stacking several results on the coating and controlling them using a lot of expressions. So, despite YYramp+, even the FX gradient toolset will surely help you produce the four gradient forms, but it'll be somewhat heavier to calculate due to the expressions and also a lengthy pile of outcomes.

Recognizing this, it could be somewhat Silly not to gain from the product's intensity, as they can be equally downloaded for free due to their own"Name your price" standing:-RRB-

- **The SFX alternative:** The FX gradient toolset has been packaged with a Lot of tilling options along with "Specific FX" Attributes, accessible by default if you've set up on the YYramp+ plugin or not.
