SmartWhois is a valuable tool for network information that allows you to locate all the available information regarding your IP address, hostname, or domain, such as the country, state, or province city, network administrator's name, provider's name, technical support, and the contact details for abuse.

In contrast to traditional Whois software, SmartWhois can find information about computers anywhere in the world, smartly querying the correct database and providing all associated records within just a few seconds. It can pull data from more than sixty servers around the world.

SmartWhois can save the information obtained in the form of an archive. Users can open this archive and update the details when the program is started. This feature lets you keep a database of host names, IP addresses, and host names. The information you gather can be saved in various formats like HTML Text, HTML, XML, and XLS. Another benefit of SmartWhois is the capacity to load a list of domain names or IP addresses as text files and then process it.

Information about a specific site is accessible to anyone. All users have to do is search for the site's address using a search engine like "whois," revealing data about the site's owner and other information.

The reason desktop alternatives exist instead of an option on a website Is primarily due to ease of use. It is because of this that apps similar to SmartWhois exist. It allows you to include IP addresses, domains, or hostnames in batch files and export them to Notepad.

SmartWhois isn't tricky to figure out. There's a search bar on the top of the layout. There, you can type in the host, IP, and the name of your address you want to look up, and the application will retrieve the information it can find for the query.

The data is presented in chronological order: if you search for a domain's name, the application will inform you of the IP corresponding to it and the country from which it originates. If it is discovered and you need to contact the administrator, or another relevant person will be displayed to you. If it is possible, DNS information, as well as an Alexa Traffic Rank, could be included.

When an app searches for an IP address, host, or domain name, the app is not sure it'll get all available information -- there are instances when there's no data.

You can include the websites you'd like to know more about using a simple text file and then feed it into SmartWhois, which will search for them all, separating them together for easy access. The users can also export the results as a text file.

Try this application if you need specific domain information on a site. Although the time it takes to find the information may be enhanced, you'll not be able to resist when SmartWhois locates the information you require.

SmartWhois can store query results which can reduce the time required to query an address. If information is contained within the cache file, it's displayed instantly without any connection to whois servers needed.

SmartWhois is a valuable tool for network information that allows you to search for all available information on your IP address, hostnames, or domain, such as states, countries, cities, network provider names, administrators, and contact details for technical support. It can help you find the answers to the following questions:

- Who owns the domain?
- The domain was registered in the year 2000. When did it become available, and what is the owner's contact information?
- Who owns the block of IP addresses?

With SmartWhois, it is possible to concentrate on what you do best. The program will instantly select the correct database

from over 100 databases of whois around the world and retrieve the actual results in just a few minutes. SmartWhois can support Internationalized Domain Names (IDNs) and allows you to query domain names using non-English characters, such as German umlauts, French accent graves, or comprise entirely of characters that originate from Chinese, Hebrew, Russian, and various other alphabets. SmartWhois is also fully compatible with IPv6 addresses.

TamoSoft SmartWhois Great Features:

- Intelligent operation: The program always looks up whois data in the correct database; you don't waste time trying them all.
- Integration with Microsoft Internet Explorer and Microsoft Outlook. Look up domain owners and IP addresses in e-mail headers instantly!
- Saving results into an archive: you can build your database that can be viewed offline.
- Batch processing of IP addresses or domain lists.
- Caching of obtained results.
- Hostname resolution and DNS caching.

- Integration with CommView Network Monitor: Can be accessed from CommView for quick, easy lookup.
- You are calling SmartWhois directly from your application.
- Wildcard queries.
- Whois console for custom queries.
- Country code reference.
- Customizable interface.
- SOCKS5 firewall support.
