Extensions to Adobe Premiere Pro that let's convert keyframes from the Tracked Mask Path to a Transform effect, meaning that any object can be tracked in the scene!

### New Changes:

- Fixed parsing clipboard in some languages other than english

Motion tracking for masks that is automatic is a feature that has been built into Adobe Premiere Pro for a lengthy time, but it was impossible to use it as an animation layer to ensure that it follows the motion of objects within the image.

But with this extension, you can convert the keyframes of "Mask Path" into keyframes of position/scale/rotation in a "Transform" effect!

You can now have automated motion tracking of an image, text or anything else, without needing to open After Effects!

The plugin is also able to be utilized in order to help stabilize video. Simply apply the tracking information to the clip in question and then apply another transform effect it, and then rotate the clip by 180 degrees during the second transformation. Then, nest the clip, rotate it 180 degrees, and scale it up when you need to!
