HTML Match v1.3.2 – Precise Analysis of Web Content Changes

2026-11-22 21:25:22

What is HTML Match?

HTML Match is the visual web page comparison utility created by Salty Brine Software for Internet professionals. Use it to analyze the changes between two revisions of an HTML file. The files can be on a local hard drive or can be web pages on the Internet. HTML Match can locate the differences in the program source code, text content, or visual aspects of the pages. Differences, down to the individual character level, can be viewed in a side-by-side layout or in one browser window.

What it is NOT

HTML Match is not just another file diff tool. Besides the ability to diff html source code, HTML Match provides the following capabilities: View the visual differences between two web pages in an actual browser window (WYSIWYG), ignore the source code and compare only the text content of the web pages. Pages can be local or on the Web.

Benefits

For software engineers, web site developers, release and quality control managers: Compare different source code of two HTML files to view what has changed between the original file and its revision. The differences are clearly marked and shown side-by-side. You can control granularity of the differences to the line level, word level, or character level.

For graphical web page designers:

View the original web page in a browser window with the changes shown graphically in-place, directly on the web page.

For technical writers, web content authors: Easily identify the changes to only the text content of the two HTML files.

Other users: Anyone that works with multiple revisions of a web page will benefit from this tool. We have specifically designed HTML Match with the needs of today's internet professional in mind.

Why buy HTML Match?

HTML Match has been designed with the needs of today’s Internet professional in mind. It is much more than your basic run-of-the-mill file differencing utility. It has been designed specifically for the comparison of web pages. There really is no competition between HTML Match and any other file comparison tool.

Select your favorite file comparison tool and try to compare a local copy of an HTML document against one that is on the Internet. While HTML Match can handle this easily, it is not possible with a generic file diff tool. The only way to do this with a generic tool is to save the web page and all of the graphics locally and hope that the browser that you used to save the web page doesn’t alter the HTML code too much. HTML Match does not work in this way. The HTML code of the web page is not altered and you are not required to save the page locally. Comparing two web pages on the Internet is as easy and as

所有软件资源 100%安全 已检测 无病毒 无篡改

标签

seamless as comparing two local HTML files. The two files compared can be local or on the Internet or any combination of the two possibilities.

From a user's perspective, your web page is not about the code that is behind it, it is about the content displayed on it. Often, the only thing that changes on a web page is the content, not the code. With HTML Match you can easily compare the text content of two web pages and ignore the code. How do you view the changes in content using any other file comparison tool? You can't unless you want to manually extract the content from each of the pages. File comparison tools will show you the html code of each file in a side-by-side display and color code the differences. HTML Match can do this too.

Additionally though, HTML Match can show the original web page in a browser window with the revisions shown in-place directly on the web page. How cool is that? And of course by now you must know that this is not possible in any other generic file comparison tool.

For comparing HTML files, HTML Match blows away all other file comparison utilities. There are a couple of other HTML Diff tools available. But HTML Match even blows them away when it comes to features and ease of use. And it does so at a fraction of the cost. More features + greater usability + fraction of the cost = GREAT DEAL!

Feature List

Compare local HTML files or web pages on the Internet

Compare either source code or visual aspects or text content only

View differences in a side by side presentation or in a one window composite view

Differences are clearly shown with color highlighting

Adjustable difference detail levels: Line level, Word level, and Character level

Allows drag and drop of files onto HTML Match for comparison

Can be run from a command line and differences saved to an HTML file.

Can be run in batch or script files.

Easy navigation from one difference to another

Search for text within the files

Bookmarks can be added to the comparison results

Ignore Space and Ignore Case comparison options supported

Files can be printed with the differences pointed out

Invoke your preferred HTML editor from within HTML Match
