After Effects   平面设计

autoParallax is an easy but effective script for After Effects.

Normally, when you add the parallax effect (2.5D movements) to the design you should adjust both the scale and the XY location after changing the Z location to ensure that it doesn't disrupt the design. (Since the size of the design changes based on the distance compared to the camera.)

After you've run the script, XY's position and scale will be changed automatically to appear exactly as the original design. All you need to do is change Z position!

autoParallax is an easy and powerful script that can be used with After Effects.

Normally, to create the parallax effect (2.5D-like motion) in a layout it is essential to change both the size and XY location after shifting the Z position. (Because the size of the image changes depending on how far the lens is from the layers)

This script will ensure that you can make sure that the XY position and the scale are automatically adjusted. Furthermore, it is easy to add the parallax effect by changing the Z location without altering the design.
