KeenTools GeoTracker 2024.3.0 for Nuke:

GeoTracker is a Foundry Nuke plugin designed to simplify and accelerate the process of tracking rigid and deformable 3D models, making complex match-moving tasks accessible even to compositing artists.

It features advanced algorithms for fast and accurate tracking, supports rigged model tracking with bone locking, and facilitates camera tracking by leveraging static scene objects.

Key tools include the Magic Keyframe for automatic precise model alignment, focal length estimation for unknown cameras, and user track integration to enhance tracking quality. Additional features, such as surface masks for excluding specific polygons and a pin-based model placement system, streamline workflows. Developed with Nuke's low-level API, GeoTracker delivers a seamless, native-like experience.
