Particle Projection v1.1 for After Effects (Richardrosenman)

2025-02-10 17:11:29　　label 我要反馈　　下载页面

Particle Projection is strong After Effects plugin for Generating complicated particle arrays projected via using a displacement layer. Particle Projection can produce magnificent and unique generative Consequences With an amazing degree of detail.

Particle Projection works by creating an array of Particles then projecting them 3D view based on this Displacement coating's corresponding pixel luminance value. The brighter the Pixel value, the larger the particle projection. Selecting interesting Displacement layers and filtering them appropriately will lead to unique projections. Imported footage is not always necessary and utilizing generative Consequences like After Impact's Turbulent sound will create Amazing outcomes.

Particle Projection Provides a pair of powerful features for Generating truly exceptional consequences. Pick the particle dimensions and spacing Independently, control the impact seriousness, fix the projection axis Stage, invert the translation and define particle colours. Since each controller Is fully animatable and keyframe in After Effects, the options are endless.

Particle Projection also provides dynamic mapping attributes. For Example, It's likely to change the particle dimensions, colour, and Transparency in line with this displacement coating's value. Brighter displacement Coating values will lead to certain particles being bigger than others, specific Particles shaded one colour versus another, or specific particles being more Transparent than another. Each mapping controller also provides a reverse Alternative for supreme control.

Particle Projection Delivers additive and normal compositing Modes letting particles piled upon one another to attribute lively and illuminating properties. This is also to the coating's compositing style Which enables multiple instances of this impact to be blended together.
