下载页面

Smart Backup and **paste keyframes** from Several layers at the same time. Currently with loop assistance.

Has the Alternative to be run without an interface so it may be utilized using ft-Toolbar

To operate with GUI install ScriptUI Panels folder, to automatically conduct GUI-less install Scripts folder

Utilization

1. Select all of the keyframes you need to replicate
2. Transfer your own time to where you want the very first keyframe to be placed
3. Click Paste

Alternatives

Don't Replicate checkbox:

That is an alternative use for those who have lots and a Lot of keyframes (100's or 1000's in a single coating)

By checking this box, then 2 things will occur when you glue your keyframes

1. The keyframes will glue much, much quicker
2. You Won't glue any easing/temporal/spatial possessions with Your own keyframes

(This alternative is mostly for when you have a lot of keyframes in monitoring, motion capture, etc. and also the keyframe interpolation isn't required)

Running With no port:

When You Have installed it to operate with no interface (like Using it by ft-Toolbar), then it is going to default to copying/pasting all of easing/temporal/spatial possessions and pasting a single loop

Custom Worth:

It Can't use plugins or effects which have custom values To get keyframes. ex. (Amounts - Histogram, Hue/Saturation - Channel Range, etc.)
