### What is Optical Flare Overlay Effects?

Optical flare overlay effects refer to the use of pre-made graphical elements, often in the form of transparent overlays, that simulate the appearance of lens flares in a photograph or video. Lens flares are artifacts that occur when bright light sources enter a camera lens, creating a variety of colorful and dynamic streaks or spots.

In graphic design and photography, lens flare overlays are applied to images to add a sense of realism, drama, or a cinematic feel. These overlays can be created manually or obtained from various sources, such as stock photo websites or graphic design asset platforms. When applied to an image, these overlays mimic the look of natural lens flares, enhancing the visual appeal of the photo.
