#### KOMPAS-3D:

This program has been designed and developed to help professionals with 3D modeling and 2D graphics. Its solid, surface, and direct modelling capabilities made it compulsory in most companies in various parts of the world. It contains all the tools necessary for the entire scope of design work, such as creating product concepts in 3D and preparing comprehensive technical documentation. In addition, KOMPAS-3D supports the main engineering file formats, so it is very easy to use in collaborative efforts without any degradation in quality. This system is widely used for engineering mechanics, industrial design, and many other fields since it performs well even for complex assemblies and grand-scale projects.

- Draft Engineering and 3D Modeling
- Create intricate 3D models with solid, mesh, or parametric modelling techniques.
- Create 2D engineering drawings such as sections and elevations with international standards.
- Systems Simulation and Analysis
- Perform simulation of design stress and load analysis calculations and verification tests through modelling before production.
- Technical Report and Documentation
- Complete the documentation, including parts lists, technical drawings, analyses, calculations, etc.
- Support the standards with company-specific requirements, such as DIN, ISO, GOST, etc.
