#### Aescripts LOOPRAN:

LOOPRAN is a powerful tool designed for creating endless physical random animations with ease. It features eight types of high-quality, physics-based animations that can be applied with a single click.

Each animation continues infinitely, introducing random changes in patterns with each iteration. Users can customize various parameters, including gravity, speed, loop count, and a range of over 20 advanced settings.

- **Random Gradient Generator:** Instantly generate over 281 trillion unique gradient patterns with a single click or long press.
- **Text Layer Customization:** Easily center the anchor point of text layers and create various text types, including paragraph text.
- **Shape Creation:** Create various preset shapes (e.g., fill, gradient, ellipse, triangle, rectangle, star, flower) with random color options, enhancing design diversity.
- **Animation Capabilities:** Apply pre-defined animations (e.g., bounce, fall, wave) and customize animation targets with auto-calculated sizes.
- **Project Management:** Organize your workflow with features to create folders, compositions, and project items.
- **Layer Management:** Create multiple layer types (e.g., text, solid, light, camera, null object, adjustment) at selected positions.
- **Expression Control Effects:** Add various expression control effects (e.g., slider, angle, color control) to manage layer properties centrally.
- **User-Friendly Settings:** Access a comprehensive settings menu for general options, project item management, layer common settings, and animation configurations.
